SUMMARY

BBA graduate transitioning into GTM Engineering, with two self-built projects and customer-facing sales experience. Built an n8n and Supabase PostgreSQL revenue workflow covering webhook intake, cache-first deduplication, Clay enrichment, deterministic scoring, gated LLM analysis, HubSpot task routing, and telemetry. Combines hands-on workflow building with first-hand experience in cold outreach, needs discovery, and follow-up. Seeking an entry-level GTM Engineering, revenue automation, or RevOps automation role.

TECHNICAL SKILLS

Hands-on (used in my projects): n8n, webhooks, REST/HTTP API calls, JavaScript (n8n Code nodes), Supabase PostgreSQL, TypeScript, React, Vite, Git/GitHub

Project-level exposure: Clay (enrichment waterfall + callback), HubSpot (task creation, CRM sync), NVIDIA-hosted LLM API, Node.js/Express proxy, Tauri

GTM concepts applied: ICP and intent scoring, lead qualification and routing, deduplication, data validation, enrichment, gated LLM calls, structured output parsing, telemetry and error logging

Sales & communication: Cold outreach, customer needs discovery, objection handling, follow-up, explaining technical solutions to non-technical owners

PROJECTS

Revenue Lifecycle Orchestration Engine (RLOE) | *n8n, Supabase, Clay, HubSpot, LLM* **Portfolio project**

- Built an n8n workflow that ingests website visitor intent signals through an inbound webhook and a periodic product-led-growth (PLG) usage poller, transforms payloads with JavaScript, and validates records, including public-email-domain filtering.
- Implemented cache-first deduplication on Supabase PostgreSQL: returning leads update the existing record and create a HubSpot task; new leads reserve a pending row before enrichment to avoid duplicate processing.
- Integrated a Clay enrichment waterfall with a callback webhook, then applied deterministic pre-filtering and pre-scoring so the LLM (NVIDIA-hosted Nemotron) runs only for eligible leads, with output parsing and validation.
- Routed leads by score to CRM actions (HubSpot task creation, high-priority sync) and logged runs and failures to Supabase tables (inbound_intent_log, rloe_telemetry, system_error_log).
- Single test execution (domain: linear.app, n8n execution 476): HTTP 200; pre-filter score 100, ICP score 95, intent score 85; routed sales_priority; 374 input / 28 output tokens, about $0.000129 estimated model cost for that one run. *Not production-scale data.*

JARVIS OS | *React, TypeScript, Vite, Tauri, Express* **In development**

- Building a personal AI desktop-assistant prototype with a React, TypeScript, and Vite front end, a Tauri desktop shell, and an Express proxy layer for AI provider calls.
- Broke the idea into concrete features and built them iteratively with AI-assisted development, reviewing and testing generated code rather than accepting it as-is.
- Diagnosed runtime issues from console and backend logs, including AI provider quota/retry behavior, repeating background prompts, and voice/TTS integration.

EXPERIENCE

Independent AI Agent & Website Projects | *Self-directed* **2024 – Present**

- Approached local business owners through cold outreach and ran needs-discovery conversations before proposing AI-agent or website solutions.
- Explained automation and AI capabilities as practical business benefits, handled objections, and followed up across multiple conversations.
- Converted outreach into approximately 6–7 delivered AI-agent and website projects for local businesses.

Intern | *Maruti Suzuki NEXA, Haldwani* **June 2025 – August 2025**

- Qualified 15–25 walk-in prospects daily through needs discovery and product demonstrations in a target-driven sales environment.
- Maintained customer records and follow-up information, and coordinated handoffs with sales executives.

EDUCATION

Bachelor of Business Administration (BBA) | *Amrapali University, Haldwani* **2023 – 2026**

Higher Secondary (12th), DAV Centenary Public School, Haldwani, 2023 | Participant, National Financial Literacy Quiz, 2025
